

```

--> load (gcdex) $ load (grobner) $
--> /*=====      subroutine 1 =====*/
--> Inverse (A, Const) := block (

    [ Nconst, vn, Tn, rwn, rpn ],

    Nconst: length (Const),
    vn: Nconst,
    varL: [],
    maxpL: [],

    Tn: 1,
    for i: 1 thru Nconst do (

        con: Const [ i ],
        y [ i]: con [ 1 ], varL: endcons (y [ i ], varL),
        D [ i]: con [ 2 ],
        pw [ i]: hipow (D [ i ], y [ i ]), maxpL: endcons (pw [ i ], maxpL), Tn: Tn * pw [ i ]

    ),
    /* 基底の次数の組み合わせ

```

Tn: $pw[1]*pw[2]*pw[3] \quad 2*3*2=12$
 pwL: 基底次数の組み合わせのリスト
 $[[0,0,0],[0,0,1],[0,1,0],[0,1,1],[0,2,0],[0,2,1],$
 $[1,0,0],[1,0,1],[1,1,0],[1,1,1],[1,2,0],[1,2,1]]$

rwn: 繰り返し同じ数を書く数(re-wright number)
 rpn: (repetition number)
 例えば上の例ではリスト[x1,x2,x3]のx3の例でいうとx2だけをみると
 $[0,0,1,1,2,2,0,0,1,1,2,2]$ となっているが、この
 $[0,0,1,1,2,2]$ の繰り返しが2回繰り返されている。
 この数を指定する数

Tn	pw[i]	rwn	rpr
12	÷ 2	= 6	1=Tn/(pw[1]*rwn)
6	÷ 3	= 2	2=Tn/(pw[2]*rwn)
2	÷ 2	= 1	6=Tn/(pw[3]*rwn)

という関係式があるので下記のプログラムとなる

*/

```
